

Perovskite Quantum Dots for LCD Displays

Quantum dots extend the color gamut of LCD displays, making them present more vibrant colors with better contrast in TVs, laptops and tablets. This is an ideal solution for HDR displays to meet Rec2020 standard. On top of that, QDs help to reduce the energy consumption. Nowadays, many TV makers adopted this technology. QUANTUM SOLUTIONS offers novel green Perovskite QDs for LCD application ("LCD backlighting" and "LCD color filters"). These materials have high photoluminescence efficiency (up to 100 %), narrow band emission (< 20-25 nm). This makes them a better quality and more environmentally friendly alternative to the current CdSe and InP QDs.

BENEFITS:

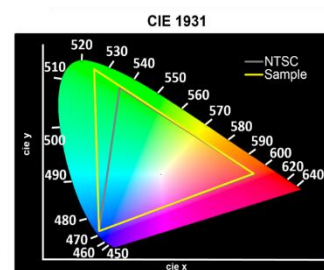

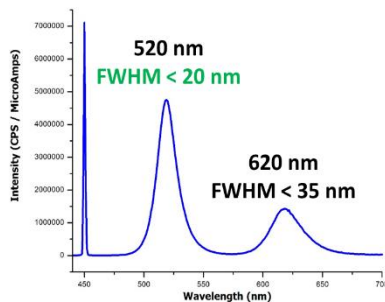

- Emission for Rec2020 and beyond: 510-530 nm
- The narrowest FWHM among all QDs (< 20-25 nm)
- High PLQY up to 100 %
- High absorption coefficient of the blue light
- RoHS compliant for LCD backlighting, cadmium free
- High reliability (RA) to thermal and photo exposure

EXPERIMENTAL DATA for LUMAR™ CsPbBr₃ QDs in a polymer film:

LUMAR™ CsPbBr₃ QDs can be used as a green emissive material in combination with red QDs (CdSe or InP QDs based) for LCD backlighting.

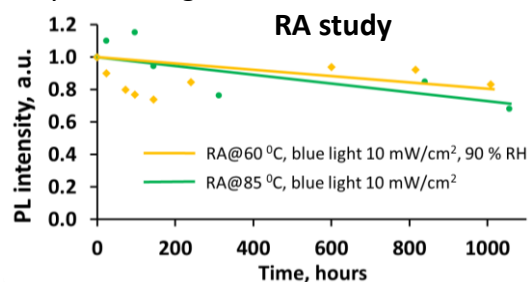

PERFORMANCE for LCD backlighting:

LUMAR™ CsPbBr ₃ QDs in a polymer film: polymer type – IBOA, QDs content - 0.5 wt %, film thickness - 100μm	
Emission	510 – 530 nm (tunable)
FHWM	< 20-25 nm
PLQY	> 60-70 %
RA@85 °C, blue light 10 mW/cm ²	1,000 hours (70-80 % of initial PL)
RA@60 °C, blue light 10 mW/cm ² , 90 % relative humidity	1,000 hours (80 % of initial PL)
PL quenching at 100 °C	65-70 % of initial PL (reversible)

120 % of NTSC area

Due to narrow FWHM of emission, LUMAR™ CsPbBr₃ QDs makes LCD to exceed NTSC standards and get it closer to Rec.2020. Our special QDs shelling enables to achieve high thermostability and photodegradation resistivity according to industrial standards to QDs.
